

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + Keep it legal Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

No perfon on Earth who reads this little work will condemn it: it is only a queftion how many millions may look through it and benefit themfelves by adopting its precepts.

THE AUTHOR.

Entered according to Act of Congress, in the year 1861, by JOHN WILEY, an the Clerk's Office of the District Court of the United States for the Southern District of New York.

## THE

## BREATH OF LIFE.

THIS communication being made in the confident belief that very many of its Readers may draw from it hints of the highest importance to the enjoyment and prolongation of their lives, requires no other apology for its appearance, nor detention of the Reader from the information which it is defigned to convey.

With the reading portion of the world it is generally known that I have devoted the greater part of my life in vifiting, and recording the looks of, the various native Races of North and South America; and during those refearches, observing the healthy condition and physical perfection of those people, in their primitive state, as contrasted with the deplorable mortality, the numerous difeases and deformities, in civilized communities, I have been led to search for, and able, I believe, to difcover, the main causes leading to such different results.

During my Ethnographic labours amongst those wild people I have visited 150 Tribes, containing more than two millions of souls; and therefore have had, in all probability, more extensive opportunities than any other man living, of examining their fanitary fystem; and if from those examinations I have arrived at refults of importance to the health and existence of mankind, I fhall have achieved a double object in a devoted and toilfome life, and fhall enjoy a twofold fatisfaction in making them known to the world; and particularly to the Medical Faculty, who may perhaps turn them to good account.\*

Man is known to be the most perfectly constructed of all the animals, and consequently he can endure more: he can outtravel the Horfe, the Dog, the Ox, or any other animal; he can fast longer; his natural life is faid to be "three fcore and ten years," while its *real*, *average length*, in civilized communities, is but half equal to that of the brutes whose natural term is not one third as long!

This enormous difproportion might be attributed to fome natural phyfical deficiency in the conftruction of Man, were it not that we find him in fome phafes of Savage life, enjoying almost equal exemption from difease and premature death, as the Brute creations; leading us to the irrefistible conclusion that there is fome lamentable fault yet overlooked in the fanitary economy of civilized life.

The human Race and the various brute-fpecies have alike been created for certain refpective terms of existence, and wifely fupplied with the physical means of fupporting that existence to its intended and natural end; and with the two creations, these powers would alike answer, as intended, for the whole term

4

<sup>\*</sup> As the information contained in this little work is believed to be of equal importance to all claffes of fociety, and of all Nations, the Author has endeavoured to render it in the fimpleft poffible form, free from ambiguity of expression and profeffional technicality of language, that all may be able alike to appreciate it; and if the work contains feveral brief repetitions, they are only those which were *intended*, and fuch as always allowed, and even difficult to be avoided, in conveying important advice.

of natural life, except from some hereditary deficiency, or some practifed abuse.

The horfe, the dog, the ox, and others of the brute creations, we are affured by the breeders of thofe animals, are but little fubject to the fatal difeafes of the lungs and others of the refpiratory or digeflive organs; nor to difeafes of the fpine, to Idiocy or Deafnefs; and their teeth continuing to perform their intended functions to the clofe of natural life, not one in a hundred of thefe animals, with proper care and a fufficiency of food, would fail to reach that period, unlefs deftroyed by intention or accident.

Mankind are everywhere a departure from this fanitary condition, though the Native Races oftentimes prefent a near approach to it, as I have witneffed amongst the Tribes of North and South America, amongst whom, in their *primitive condition*, the above-mentioned difeases are feldom heard of; and the almost unexceptional regularity, beauty, and foundness of their teeth last them to advanced life and old age.

In civilized communities, better fheltered, lefs exposed, and with the aid of the ablest professional skill, the fanitary condition of mankind, with its variety, its complication and fatality of difeases—its aches and pains, and mental and physical deformities, presents a more lamentable and mournful list, which plainly indicates the existence of some extraordinary, latent cause, not as yet sufficiently appreciated, and which it is the sole object of this little work to expose.

From the Bills of Mortality which are annually produced in the civilized world, we learn that in London and other large towns in England, and cities of the Continent, *on an average*, one half of the human Race die before they reach the age of five years, and one half of the remainder die before they reach the age of twenty-five, thus leaving but one in four to fhare the chances of lafting from the age of twenty-five to old age.

Statistical accounts showed not many years pass, that in London, one half of the children died under *three* years, in Stockholm, one half died under *two* years, and in Manchester, one half died under *five* years; but owing to recent improved fanitary regulations, the numbers of premature deaths in those cities are much diminiss of premature deaths in those shift given, no doubt, very near the truth, at the present time; and still a lamentable statement for the contemplation of the world, by which is seen the frightful gauntlet that civilized man runs in his passes.

The fanitary condition of the Savage Races of North and South America, a few inflances of which I fhall give, not by quoting a variety of authors, but from effimates carefully made by myfelf, whilft travelling among those people, will be found to present a striking contrast to those just mentioned, and so widely different as naturally, and very justly, to raise the inquiry into the causes leading to such diffimilar results.

Several very refpectable and credible modern writers have undertaken to fhow, from a hoft of authors, that premature mortality is greater amongft the Savage, than amongft the Civilized Races; which is by no means true, excepting amongft those communities of favages who have been corrupted, and their fimple and temperate modes of life changed by the diffipations and vices introduced among them by civilized people.

In order to draw a fair contrast between the refults of habits amongst the two races, it is neceffary to contemplate the two people living in the uninvaded habits peculiar to each; and it would be well alfo, for the writer who draws those contrast, to fee with his own eyes, the customs of the native Races, and obtain his information from the lips of the people themselves, instead of trusting to a long fuccession of authorities, each of which has quoted from his predecessor, when the original one has been unworthy of credit or has gained his information from unreliable, or ignorant, or malicious fources.

There is, perhaps, no other fubject upon which historians and other writers are more liable to lead the world into erroneous conclusions than that of the true native customs and charaster of Aboriginal Races; and that from the universal dread and fear which have generally deterred historians and other men of Science from penetrating the folitudes inhabited by these people, in the prastice of their primitive modes.

There always exifts a broad and moving barrier between favage and civilized communities, where the first flaking of hands and acquaintance take place, and over which the demoralizing and deadly effects of diffipation are taught and practifed; and from which, unfortunately, both for the character of the barbarous races and the benefit of fcience, the customs and the perfonal appearance of the favage are gathered and portrayed to the world.

It has been too much upon this field that historians and other writers have drawn for the exaggerated accounts which have been published, of the excessive mortality amongs the favage Races of America, leading the world to believe that the actual premature waste of life caused by the diffipations and vices introduced, with the accompanying changes in the modes of living in such districts, were the proper statistics of those people. I have vifited thefe femi-civilized degradations of favage life in every degree of latitude in North America, and to a great extent alfo in Central and South America, and as far as this fyftem extends, I agree with thofe writers who have contended in general terms, that premature mortality is proportionally greater amongft the Native Races than in Civilized communities; but as I have alfo extended my vifits and my inquiries into the tribes in the fame latitudes, living in their primitive ftate, and practifing their native modes, I offer myfelf as a living witnefs, that whilft in that condition, the Native Races in North and South America are a healthier people, and lefs fubject to premature mortality (fave from the accidents of War and the Chafe, and alfo from Small-pox and other peftilential difeafes introduced amongft them), than any civilized Race in exiftence.

Amongst a people who preferve no Records and gather no Statistics, it has been impossible to obtain *exact* accounts of their annual deaths, or strict proportionate estimates of deaths before and between certain ages; but from verbal estimates given me by the Chiefs and Medical men in the various tribes, and whofe statements may in general be relied on as very near the truth, there is no doubt but I have been able to obtain information on these points which may fafely be relied on as a just average of the premature mortality in many of those Tribes, and which we have a right to believe would be found to be much the fame in most of the others.

As to the melancholy proportions of deaths of children in civilized communities already given, there is certainly no parallel to it to be found amongst the North or South American Tribes, where they are living according to their primitive modes; nor

8

do I believe that a fimilar mortality can be found amongst the children of any aboriginal race on any part of the globe.

Amongst the North American Indians, at all events, where two or three children are generally the utmost refults of a marriage, fuch a rate of mortality could not exist without foon depopulating the country; and as a justification of the general remark I have made, the few following instances of the numerous estimates which I received and recorded amongst the various tribes, I offer in the belief that they will be received as matters for astonishment, calling for fome explanation of the causes of fo wide a contrast between the Bills of Mortality in the two Races.

Whilft refiding in a fmall village of Guarani of 250 perfons, on the banks of the Rio Trombutas, in Brazil; amongft the queftions which I put to the Chief, I defired to know as near as poffible, the number of children under 10 years of age, which his village had loft within the laft 10 years, a fpace of time over which his recollection could reach with tolerable accuracy. After he and his wife had talked the thing over for fome time, they together made the following reply, viz.—that "they could recolled but three deaths of children within that fpace of time : one of thefe was drowned, a fecond one was killed by the kick of a horfe, and the third one was bitten by a Rattle Snake."

This fmall tribe, or Band, living near the base of the Acarai Mountains, refembled very much in their personal appearance and modes of life, the numerous bands around them; all mounted on good horse; living in a country of great profusion, both of animal and vegetable food.

The "Sleepy Eyes," a celebrated chief of a Band of Sioux,

in North America, living between the head-waters of the Miffisfippi and Miffouri Rivers, in reply to fimilar queftions, alfo told me that in his band of 1500, he could not learn from the women that they had loft any of their children in that time, except fome two or three who had died from accidents. He told me that the women of his tribe had no inftances of ftill-born children; and they feemed not even to know the meaning of "Abortions."

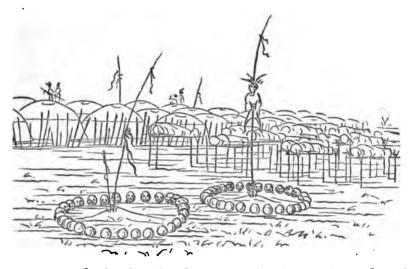

I asked him if any of their children were ever known to die from the pains of cutting their teeth, to which he replied, that they always feem to fuffer more or less at that period; but that he did not believe that in the whole Sioux Tribe a child ever died from that cause.

This Tribe I found living in their primitive condition.

Amongst the tribe of Mandans, on the upper Miffouri, a tribe of 2000, and living entirely in their primitive state, I learned from the Chiefs, that the death of a child under the age of 10 years was a very unufual occurrence; and from an examination of the dead bodies in their Cemetery, at the back of their village, which were enveloped in skins, and resting separately on little scaffolds of poles erected on the prairies, amongst some 150 of such, I could discover but the embalmments of eleven children, which strongly corroborated in my mind, the statements made to me by the Chiefs, as to the unfrequency of the deaths of children under the age above-mentioned; and which I found soft further, if not more strongly, corroborated in the collection of human Skulls preferved and lying on the ground underneath the fcaffolds.

By the cuftom peculiar to this tribe, when the fcaffolds

decay, on which the bodies reft, and fall to the ground, the fkulls, which are bleached, are carefully and fuperfitioufly preferved in several large circles on the ground; and amongft feveral hundreds of these fkulls, I was forcibly ftruck with the almost incredibly fmall proportion of crania of children; and

even more fo, in the almost unexceptional completeness and foundness (and total absence of malformation) of their beautiful fets of teeth, of all ages, which are forupulously kept together, by the lower jaws being attached to the other bones of the head.\*

In this Tribe of 2000, I learned also from the chiefs, that there was not an inftance of *Idiocy* or *Lunacy*—of *crooked fpine* 

\* A flort time after I had definited to the World the beautiful formation and polifh of the teeth in these skulls, the *forceps came*, and (like the most of thos left in the Indian graves on the frontiers), the most beautiful of them, which ha chewed Buffalo meat for 25 years or a half century, are now chewing *Bread and Butter* in various parts of the World. (or hunch-back), of *Deaf and Dumb*, or of other deformity of a difabling kind.

The inftances which I have thus far ftated, as rather extraordinary cafes of the healthfulnefs of their children, in the above tribes, are neverthelefs, not far different from many others which I have recorded in the numerous tribes which I have vifited; and the apparently fingular exemption of the Mandans, which I have mentioned, from mental and phyfical deformities, is by no means peculiar to that tribe; but, almost without exception, is applicable to all the tribes of the American Continent, where they are living in their primitive condition, and according to their original modes.

This Tribe subfifts chiefly on Buffalo meat, and maize or Indian corn, which they raifed to a confiderable extent.

Amongst two millions of these wild people whom I have visited, I never faw, or heard of a *hunch-back* (crooked spine) though my inquiries were made in every tribe; nor did I ever *fee* an *Idiot* or *Lunatic* amongst them, though I heard of some three or four, during my travels, and perhaps of as many *Deaf* and *Dumb.*\*

\* Some writers upon whom the world have relied for a correct account of the cuftoms of the American Indians, have affigned as the caufe of the almost entire abfence of mental and phyfical deformities amongst these people, that they are in the habit of putting to death all who are thus afflicted; but fuch is not only an unfounded and unjust, but difgraceful affumption on the part of those by whom the opinions of the world have been led; for, on the contrary, in every one of the few very cafes of the kind, which I have met or could hear of, amongst two millions of these people, these unfortunate creatures were not only fupplied and protected with extraordinary care and fympathy, but were in all cafes guarded with a

Shar-re-tar-rufte, an aged and venerable chief of the Pawnee-Picts, a powerful tribe living on the head-waters of the Arkanías River, at the bafe of the Rocky Mountains, told me in anfwer to queftions, "we very feldom lofe a fmall child—none of our women have ever died in childbirth—they have no medical attendance on these occasions—we have no idiots or lunatics nor any Deaf and Dumb, or Hunch-backs, and our children never die in teething."

This Tribe I found living entirely in their primitive state; their food, Buffalo flesh and Maize, or Indian corn.

Ski-fe-ro-ka, chief of the Kiowas, a fmall Tribe, on the headwaters of the Red River, in Western Texas, replied to me, "my wife and I have lost two of our small children, and perhaps ten or twelve have died in the tribe in the last ten years—we have lost none of our children by teething—we have no Idiots, no Deaf and Dumb, nor hunch-backs."

This Tribe I found living in their primitive condition, their food Buffalo flefh and venison.

*Cler-mont*, chief of the Ofages, replied to my queffions, "before my people began to ufe '*fire-water*,' it was a very unufual thing for any of our women to lofe their children; but I am forry to fay that we lofe a great many of them now; we have no Fools (Idiots), no Deaf and Dumb, and no hunch-backs ---our women never die in childbirth nor have dead children."

Naw-kaw, chief of the Winnebagoes, in Wisconfin, the

*fuper/littous* care, as the probable receptacles of fome important myftery, defigned by the Great Spirit, for the undoubted benefit of the families or Tribes to which they belonged.

remnant of a numerous and warlike tribe, now femi-civilized and reduced, "our children are not now near fo healthy as they were when I was a young man; it was then a very rare thing for a woman to lofe her child; now it is a very difficult thing to raife them,"—to which his wife added—" fince our hufbands have taken to drink fo much whifkey our babies are not fo ftrong, and the greater portion of them die; we cannot keep them alive." The chief continued, "we have no Idiots, no Deaf and Dumb, and no hunch-backs; our women never die in childbirth, and they do not allow Doftors to attend the n on fuch occafions."

Food of this Tribe, Fifh, venifon, and vegetables.

Kee-mon-faw, chief of the Ka/ka/kias, on the Miffouri, once a powerful and warlike tribe, told me that he could recolled when the children of his tribe were very numerous and very healthy, and they had then no Idiots, no deaf and dumb, nor hunchbacks; but that the fmall-pox and whifkey had killed off the men and women, and the children died very fast. "My Mother," faid he, "who is very old, and my little fon and myfelf, all of whom are now before you, are all that are left in my tribe, and I am the chief!"

The above, which are but a very few of the numerous effimates which I have gathered, when compared with the flatifics of premature deaths and mental and phyfical deformities in civilized communities, form a contraft fo flriking, between the fanitary conditions of the two Races who are born the fame, and whofe terms of natural life are intended to be equal, as plainly to flow, that through the vale of their existence, in civilized Races, there must be fome hidden cause of difease not

14

yet fufficiently appreciated, and which the *Materia Medica* has not effectually reached.

Under this conviction I have been ftimulated to fearch amongst the Savage Races for the caufes of their exemption from, and amongst the civilized communities for the caufes of their fubjection to, fo great a calamity, and this I believe I have difcovered, commencing in the cradle, and accompanying civilized mankind through the painful gauntlet of life to the grave; and in poffeffion of this information, when I look into the habits of fuch communities, and fee the operations of this caufe, and its lamentable effects, I am not in the least aftonished at the frightful refults which the lists of mortality sources in the able, and that Nature can fuccessfully battle fo long as the does, against the abufes with which the often has to contend.

This caufe I believe to be the fimple neglect to fecure the vital and intended advantages to be derived from quiet and natural fleep; the great phyfician and reftorer of mankind, both Savage and Civil, as well as of the Brute creations.

Man's cares and fatigues of the day become a daily difeafe, for which quiet fleep is the cure; and the All-wife Creator has fo conftructed him that his breathing lungs fupport him through that fleep, like a perfect machine, regulating the digeftion of the ftomach and the circulation of the blood, and carrying repofe and reft to the utmost extremity of every limb; and for the protection and healthy working of this machine through the hours of repose, He has formed him with nostrils intended for measuring and tempering the air that feeds this moving principle and fountain of life; and in proportion as the quieting and reftoring influence of the lungs in natural repose, is carried ł

to every limb and every organ, fo in *unnatural* and *abufed* repofe, do they fend their complaints to the extremities of the fystem, in various difease; and under continued abufe, fall to pieces themselves, carrying inevitable destruction of the fabric with them in their decay.

The two great and primary phafes in life and mutually dependant on each other, are *waking* and *fleeping*; and the abufe of either is fure to interfere with the other. For the first of these there needs a lifetime of teaching and prastice; but for the enjoyment of the latter, man needs no teaching, provided the regulations of the All-wise Maker and Teacher can have their way, and are not contravened by pernicious habits or erroneous teaching.

If man's unconfcious existence for nearly one-third of the hours of his breathing life depends from one moment to another, upon the air that paffes through his nostrils; and his repose during those hours, and his bodily health and enjoyment between them, depend upon the southed and tempered character of the currents that are passed through his nose to his lungs, how mysteriously intricate in its construction and important in its functions is that feature, and how difastrous may be the omission in education which fanctions a departure from the full and natural use of this wife arrangement?

When I have feen a poor Indian woman in the wildernefs, lowering her infant from the breaft, and preffing its lips together as it falls afleep in its cradle in the open air, and afterwards looked into the Indian multitude for the refults of fuch a practice, I have faid to myfelf, "glorious education! fuch a Mother deferves to be the nurfe of Emperors." And when I have feen the *careful, tender mothers* in civilized life, covering the faces of their infants fleeping in overheated rooms, with their little mouths open and gafping for breath; and afterwards looked into the multitude, I have been ftruck with the evident evil and lafting refults of this incipient ftage of education; and have been more forcibly ftruck, and fhocked, when I have looked into the Bills of Mortality, which I believe to be fo frightfully fwelled by the refults of this habit, thus contracted, and practifed in contravention to Nature's defign.

There is no animal in nature excepting Man, that fleeps with the mouth open; and with mankind, I believe the habit, which is not natural, is generally confined to civilized communities, where he is nurtured and raifed amidft enervating luxuries and unnatural warmth, where the habit is eafily contracted, but carried and practifed with great danger to life in different latitudes and different climates; and, in fudden changes of temperature, even in his own houfe.

The phyfical conformation of man alone affords fufficient proof that this is a habit against instinct, and that he was made, like the other animals, to fleep with his mouth shut—fupplying the lungs with vital air through the nostrils, the natural channels; and a strong corroboration of this fast is to be met with amongst the North American Indians, who strictly adhere to Nature's law in this respect, and show the beneficial results in their fine and manly forms, and exemption from mental and physical difeases, as has been stated.

The Savage infant, like the offspring of the brute, breathing the natural and wholefome air, generally from inftinct, clofes its mouth during its fleep; and in all cafes of exception the mother rigidly (and *cruelly*, if neceffary) enforces Nature's Law in the manner explained, until the habit is fixed for life, of the

#### THE BREATH OF LIFE.

importance of which the feems to be perfectly well aware. But when we turn to civilized life, with all its comforts, its luxuries, its fcience, and its Medical tkill, our pity is enlifted for the tender germs of humanity, brought forth and careffed in fmothered atmospheres which they can only breathe with their mouths wide open, and nurtured with too much thoughtleffneis to prevent their contracting a habit which is to florten their days with the croup in infancy, or to turn their brains to Idiocy or Lunacy, and their fpines to curvatures—or in manhood, their fleep to fatigue and the nightmare, and their lungs and their lives to premature decay.\*

If the habit of fleeping with the mouth open is fo deftructive to the human conftitution, and is caufed by fleeping in confined and overheated air, and this under the imprudent fanction of mothers, they become the primary caufes of the mifery of their own offspring; and to them, chiefly, the world muft look for the correction of the error, and, confequently, the benefaction of mankind. They flould first be made acquainted with the fact that their infants don't require heated air, and that

\* The weekly Bills of Mortality in London flow an amount of 10, 15, and fometimes 20 deaths of infants per week, from fuffocation, in bed with their parents; and Mr. Wakley, in May, 1860, in an inqueft on an infant, flated that " he had held inquefts over more than 100 Infants which had died during the paft winter, from the fame caufe, their parents covering them entirely over, compelling them to breathe their own breath."—*Times*.

The Registrar General shows an average of over 700,000 infants born in England per annum, and over 100,000, which die under one year of age—12,738 of these of Bronchitis, 3,660 from the pains of teething, and 19,000 of convulsions, and says, "fuffocation in bed, by overlaying or shutting off the air from the child, is the most frequent cause of violent deaths of children in England." they had better fleep with their heads out of the window than under their mother's arms—that middle-aged and old people require more warmth than children, and that to embrace their infants in their arms in their fleep during the night, is to fubject them to the heat of their own bodies; added to that of feather beds and overheated rooms, the relaxing effects of which have been mentioned, with their pitiable and fatal confequences.

There are many, of courfe, in all ranks and grades of fociety, who efcape from contracting this early and dangerous habit, and others who commence it in childhood, or in manhood, a very few of whom live and fuffer under it to old age, with conflictuations fufficiently ftrong to fupport Nature in her defperate and continuous ftruggle against abufe.

When we observe amongst very aged perfons that they almost uniformly close the mouth firmly, we are regarding the refults of a long practifed and healthy habit, and the furviving few who have thereby escaped the fatal consequences of the evil practice I am condemning.

Though the majority of civilized people are more or lefs addiated to the habit I am speaking of, comparatively few will admit that they are subject to it. They go to sleep and awake, with their mouths shut, not knowing that the infidious enemy, like the deadly Vampire that imperceptibly sucks the blood, gently steals upon them in their sleep and does its work of death whils they are unconfcious of the evil.

Few people can be convinced that they fnore in their fleep, for the fnoring is flopped when they awake; and fo with breathing through the mouth, which is generally the caufe of fnoring the moment that confcioufnefs arrives the mouth is clofed, and Nature refumes her ufual courfe. In natural and refreshing fleep, man breathes but little air; his pulse is low; and in the most perfect state of repose he almost ceases to exist. This is necessary, and most wifely ordered, that his lungs, as well as his limbs, may rest from the labour and excitements of the day.

Too much fleep is often faid to be deftructive to health; but very few perfons will fleep too much for their health, provided they fleep in the right way. Unnatural fleep, which is irritating to the lungs and the nervous fyftem, fails to afford that reft which fleep was intended to give, and the longer one lies in it, the lefs will be the enjoyment and length of his life. Any one waking in the morning at his ufual hour of rifing, and finding by the drynefs of his mouth, that he has been fleeping with the mouth open, feels fatigued, and a wifh to go to fleep again; and, convinced that his reft has not been good, he is ready to admit the truth of the flatement above made.

There is no perfect fleep for man or brute, with the mouth open; it is unnatural, and a strain upon the lungs which the expression of the countenance and the nervous excitement plainly show.

Lambs, which are nearly as tender as human infants, commence immediately after they are born, to breathe the chilling air of March and April, both night and day, afleep and awake, which they are able to do, becaufe they breathe it in the way that Nature defigned them to breathe. New-born infants in the Savage Tribes are exposed to nearly the fame neceffity, which they endure perfectly well, and there is no reason why the opposite extreme should be practified in the civilized world, entailing so much misfortune and misery on mankind.

It is a pity that at the very *ftarting point* of life-Man fhould

۱

be ftarted wrong—that mothers fhould be under the erroneous belief that while their infants are awake they mult be watched; but afleep, they are "doing well enough."

Education is twofold, mental and phyfical; the latter of which alone, at this early ftage, can be commenced; and the mother fhould know that fleep, which is the great renovater and regulator of health, and in fact, the *food* of *life*, fhould be enjoyed in the manner which Nature has defigned; and therefore that her clofest forutiny and watchfulness, like that of the poor Indian woman, should guard her infant in those important hours, when the shooting germs of constitution are starting, on which are to depend the happiness or misery of her offspring.

It requires no more than common fense to perceive that Mankind, like all the Brute creations, should close their mouths when they close their eyes in fleep, and breathe through their nostrils, which were evidently made for that purpose, instead of dropping the under jaw and drawing an over draught of cold air directly on the lungs, through the mouth; and that in the middle of the night, when the fires have gone down and the air is at its coldest temperature—the fystem at rest, and the lungs the least able to withstand the shock.

For those who have fuffered with weakness of the lungs or other diseases of the cheft, there needs no proof of this fact; and of those, if any, who are yet incredulous, it only requires that they should take a candle in their hand and look at their friends alleep and shoring; or with the Nightmare (or without it), with their eyes shut and their mouths wide open—the very pictures of distress—of suffering, of Idiocy, and Death; when Nature designed that they should be smilling in the soothing and invigorating forgetfulness of the fatigues and anxieties of the day, which are diffolving into pleafurable and dreamy fhadows of "realities gone by."

Who ever waked out of a fit of the Nightmare in the middle of the night with his mouth strained open and dried to a husk, not knowing when, or from where, the faliva was coming

to moisten it again, without being willing to admit the mischief that fuch a habit might be doing to the lungs, and consequently to the ftomach, the brain, the nerves, and every other organ of the fyftem?

Who, like myfelf, has fuffered from boyhood to middle age, everything but death from this enervating and unnatural habit, and then, by a *determined* and *uncompromifing* effort, has thrown it off, and gained, as it were, a new leafe of life and the enjoyment of reft—which have lasted him to an advanced age through all exposures and privations, without admitting the mischief of its confequences?

Nothing is more certain than that for the prefervation of human health and life, that most mysterious and incomprehensible, felf-ading principle of life which supports us through the restoring and unconscious vale of sleep, should be protected and aided in every way which Nature has prepared for the purpose, and not abused and deranged by forcing the means of its support through a different channel.

We are told that "the breath of life was breathed into man's noftrils"—then why fhould he not *continue* to live by breathing it in the fame manner ?\*

• A recently invented aid for the lungs, which the ufual efforts for pecuniary refults, and the accuftomed and unfortunate rage for novelties have been pufhing into extensive use, has been doing great mischief in fociety during the last few years; and by its injudicious use, I believe thousands on thousands have been hurried to the grave. I refer to the "Respirators," so extensively in use, and as generally "in fashion," amongst the Fair Sex. For perfons very weak in the lungs, and who have contracted the habit so forting and so long that they cannot breathe excepting through the open mouth, this appliance may be beneficial, in the open air; but thousands of others, to be eccentric or fashionable, place it over their mouths when they step into the ftreet; and to make any use of it, must open their mouths and breathe through it, by which indifcretion they are thought. The mouth of man, as well as that of the brutes, was made for the reception and maftication of food for the ftomach, and other purpofes; but the noftrils, with their delicate and fibrous linings for purifying and warming the air in its paffage, have been myfteriously conftructed, and defigned to ftand guard over the lungs—to meafure the air and equalize its draughts, during the hours of repofe.

The atmosphere is nowhere pure enough for man's breathing until it has paffed this mysterious refining process; and therefore the imprudence and danger of admitting it in an unnatural way, in double quantities, upon the lungs, and charged with the furrounding epidemic or contagious infections of the moment.

The impurities of the air which are arrefted by the intricate organizations and mucus in the nofe are thrown out again from its interior barriers by the returning breath; and the tingling excitements of the few which pafs them, caufe the mufcular involitions of fneezing, by which they are violently and fuccefs fully refifted.

The air which enters the lungs is as different from that which enters the noftrils as diffilled water is different from the water in an ordinary ciftern or a frog-pond. The arrefting and purifying process of the nose, upon the atmosphere with its poisonous ingredients, passing through it, though less perceptible, is not less diffind, nor less important than that of the mouth,

leffly contracting the most dangerous habit which they can subject themselves to, and oftentimes catching their death in a few days, or in a few hours; little aware that closed lips are the best protection against cold air, and their nostrils the best and fafest of all Respirators. which ftops cherry-ftones and fifh-bones from entering the ftomach.

This intricate organization in the ftructure of man, unaccountable as it is, feems in a meafure diverted of myftery, when we find the fame phenomena (and others perhaps even more furprifing) in the phyfical conformation of the lower order of animals; and we are again more altonithed when we fee the myfterious fenfitivenefs of that organ inftinctively and inftantaneoufly feparating the *gafes*, as well as arrefting and rejecting the *material* impurities of the atmosphere.

This unaccountable phenomenon is feen in many cafes. We fee the fifh, furrounded with water, breathing the air upon which it exifts. It is a known fact that man can inhale through his nofe, for a certain time, *mephitic air*, in the bottom of a well, without harm; but if he opens his mouth to answer a question, or calls for help, in that position, his lungs are closed and he expires. Most animals are able to inhale the same for a confiderable time without destruction of life, and, no doubt, folely from the fact that their respiration is through the nostrils, in which the position effluvia are arrested.

There are many mineral and vegetable poifons alfo, which can be inhaled by the nofe without harm, but if taken through the mouth deftroy life. And fo with poifonous reptiles, and poifonous animals. The man who kills the Rattlefnake, or the Copperhead, and ftands alone over it, keeps his mouth fhut, and receives no harm; but if he has companions with him, with whom he is converfing over the carcafes of thefe reptiles, he inhales the poifonous effluvia through the mouth, and becomes deadly fick, and in fome inftances death enfues.

Infinitefimal infects alfo, not visible to the naked eye, are

inhabiting every drop of water we drink and every breath of air we breathe; and minute particles of vegetable fubftances, as well as of poifonous minerals, and even glafs and filex, which float imperceptibly in the air, are difcovered coating the refpiratory organs of man; and the clafs of birds which catch their food in the air with open mouths as they fly, receive thefe things in quantities, even in the hollow of their bones, where they are carried and lodged by the currents of air, and detected by microfcopic inveftigation.

Against the approach of these things to the lungs and to the eye, Nature has prepared the guard by the mucous and organic arrangements, calculated to arrest their progress. Were it not for the liquid in the eye, arresting, neutralizing, and carrying out the particles of dust communicated through the atmosphere, Man would foon become blind; and but for the mucus in his nostrils, absorbing and carrying off the poisonous particles and effluvia for the protection of the lungs and the brain, mental derangement, consumption of the lungs, and death would ensue.

How eafy, and how reafonable, it is to fuppofe then, that the inhalation of fuch things to the lungs through the expanded mouth and throat may be a caufe of confumption and other fatal difeafes attaching to the refpiratory organs; and how fair a fuppofition alfo, that the deaths from the dreadful Epidemics, fuch as Cholera, Yellow Fever, and other peftilences, are caufed by the inhalation of animalcules in the infected diftricts; and that the victims to those difeafes are those portions of fociety who inhale the greatest quantities of those poisonous infects to the lungs and to the stomach.

In man's waking hours, when his limbs, and muscles, and

his mind, are all in action, there may be but little harm in inhaling through the mouth, if he be in a healthy atmosphere; and at moments of violent action and excitement, it may be necesary. But when he lies down at night to reft from the fatigues of the day, and yields his fystem and all his energies to the repose of fleep; and his volition and all his powers of refistance are giving way to its quieting influence, if he gradually opens his mouth to its widest strain, he lets the enemy in that chills his lungs—that racks his brain—that paralyses his stomach—that gives him the nightmare—brings him Imps and Fairies that dance before him during the night; and during the following day, headache—toothache—rheumatifm—dyspepsia, and the gout.

That man knows not the pleafure of fleep; he rifes in the morning more fatigued than when he retired to reft—takes pills and remedies through the day, and renews his difeafe every night. A guilty conficience is even a better guarantee for peaceful reft than fuch a treatment of the lungs during the hours of fleep. Deftructive irritation of the nervous fyftem and inflammation of the lungs, with their confequences, are the immediate refults of this unnatural habit; and its continued and more remote effects, confumption of the lungs and death.

Befides this frequent and most fatal of all diseafes, Bronchitis, Quinfey, Croup, Asthma, and other diseafes of the respiratory organs, as well as Dyspepsia, gout of the stomach, Rickets, Diarshœa, diseases of the liver, the heart, the spine, and the whole of the nervous system, from the brain to the toes, may chiefly be attributed to this deadly and unnatural habit; and any Physician can easily explain the manner in which these various parts of the system are thus affected by the derangement of the natural functions of the machine that gives them life and motion.

All perfons going to fleep fhould think, not of their bufinefs, not of their riches or poverty, their pains or their pleafures, but, of what are of infinitely greater importance to them, their lungs; their best friends, that have kept them alive through the day, and from whole quiet and peaceful repole they are to look for happiness and strength during the toils of the following day. They fhould first recollect that their natural food is fresh air; and next, that the channels prepared for the fupply of that food are the noftrils, which are fupplied with the means of purifying the food for the lungs, as the mouth is conftructed to feleat and masticate the food for the stomach. The lungs fhould be put to reft as a fond Mother lulls her infant to fleep; they fhould be fupplied with vital air, and protected in the natural use of it; and for fuch care, each fucceffive day would repay in increafed pleafures and enjoyments.

The lungs and the ftomach are too near neighbours not to be mutually affected by abufes offered to the one or the other; they both have their natural food, and the natural and appropriate means prepared by which it is to be received. Air is the efpecial food of the lungs, and not of the Stomach. He who fleeps with his mouth open draws cold air and its impurities into the ftomach as well as into the lungs; and various difeafes of the ftomach, with indigeftion and dyfpepfia, are the confequences. Bread may almost as well be taken into the lungs, as cold air and wind into the ftomach.

A very great proportion of human difeafes are attributed to the flomach, and are there met and treated; yet I believe they have a higher origin, the lungs; upon the healthy and regular

28

action of which the digestive, as well as the respiratory and nervous systems depend; the moving, active, principle of life, and *life itfelf*, are there; and whatever deranges the natural action at that fountain affects every function of the body.

The ftomach performs its indifpenfable, but fecondary part, whilft the moving motive power is in healthy action, and no longer. Man can exift feveral days without food, and but about as many minutes, without the action of his lungs. Men habitually fay "they don't fleep well, becaufe fomething is wrong in their ftomachs," when the truth may be, that their ftomachs are wrong becaufe fomething is wrong in their fleep.

If this dependent affinity in the human fystem be true, befetting man's life with fo many dangers flowing from the abuse of his lungs, with the fast that the brute creations are exempt from all of these dangers, and the favages in the wilderness nearly fo, how important is the question which it raises whether the frightful and unaccountable Bills of Mortality amongst the civilized Races of mankind are not greatly augmented, if not chiefly caused, by this error of life, beginning, as I have faid, in the cradle, and becoming by habit, as it were, *a fecond nature*, to weary and torment Mankind to their graves?

Man is created, we are told, to live three fcore and ten years, but how fmall a proportion of mankind reach that age, or half way, or even a quarter of the way to it! We learn from the official Reports before alluded to, that in civilized communities, one half or more perifh in infancy or childhood, and one half of the remainder between that and the age of 25, and Phyficians tell us the difeafes they die of; but who tells us of the *caufes* of those difeafes? All effects have their caufes difeafe is the caufe of death—and there is a caufe for difeafe When we fee the Brute creations exempted from premature death, and the Savage Races comparatively fo, whilft civilized communities flow fuch lamentable Bills of Mortality, it is but a rational deduction that that fatality is the refult of habits not practified by favages and the brute creations; and what other characteriftic differences in the habits of the three creations flrike us as fo diffindly different, and fo proportioned to the refults, as already flown; the *firft*, with the mouth always flut; the *fecond*, with it flut during the night and most of the day; and the *third*, with it open most of the day and all of the night? The *firft* of these are free from disease; the *fecond*, comparatively fo; and the *third* flow the lamentable results in the Bills of Mortality already given.

How forcible and natural is the deduction from these facts, that here may be the great and principal cause of such widely different refults, strengthened by the other facts, that the greater part of the fatal diseases of the body as well as diseases of the mind, before mentioned, are such as could, and *would* flow, from such an unnatural abuse of the lungs, the fountain and mainspring of life; and how important also, is the question raised by these facts, how far such an unnatural habit exposes the human race to the dangers from Epidemic diseases. The Brute creations are everywhere free from Cholera and Yellow fever, and I am a living witness that the Assist Cholera of 1831, was everywhere arrested on the United States frontier, when in its progress it reached the Savage tribes living in their primitive condition; having been a traveller on those frontiers during its ravages in those regions.

Epidemic difeafes are undoubtedly communicated through the medium of the atmosphere, in poisonous animalcules or infectious agents; and what conclusion can be more rational, than that he who fleeps with his mouth open during the night, drawing an increased quantity of infected atmosphere directly on the lungs and into the stomach, will increase his chances of contracting the difease? And how interesting to Science, and how infinitely important to the *Welfare* of the *Human Race might yet* be the enquiry, whether the thousands and millions of victims to Cholera and yellow fever, were not those very portions of fociety who were in the habit of sleeping with their mouths open, in the districts infected with those awful scourges!\*

It is a well-known fait that fifthes will die in a few moments, in their own element, with their mouths kept open by the hook; and I ftrongly doubt whether a horfe or an ox would live any length of time, with its mouth fastened open with a block of wood, during the accustomed hours of its repose; and I believe

\* My opinions on this important subject having been formed many years ago, as feen in the foregoing pages, I have had opportunities of making observations of an interesting nature, in my recent travels; and amongst those opportunities, one of the most impressive, whilst I was making the voyage on one of the Mail Steamers from Montevideo to Pernambuco, on the coaft of Brazil, in the fummer of 1857, during which melancholy voyage about 30 out of 80 passengers died of the Yellow fever, and were launched from the deck into the fea, according to the cuftom. Having been twice tried by that difease on former occasions, and consequently feeling little or no alarm for myfelf, I gave all my time and attention to the affistance of those who were afflicted. Aware of the difficulty of closing the mouth of a corpfe whofe mouth has been habitually open through life, and obferving that nearly every one launched from the veffel had the character and expresfion ftrongly imprefive of the refults of that habit, I was irrefiftibly led to a private and fecret fcanning of faces at the table and on deck, and of fix or feven perfons for whom I had confequent apprehenfions, I observed their seats were in a day or two vacated, and afterwards I recognifed their faces, when brought on deck, as fubjects for the laft, fad ceremony.

that the derangement of the fyftem by fuch an experiment would be fimilar to that in the human frame, and that death would be fooner and more certain; and I believe alfo, that if the American Races of Savages which I have vifited, had treated this fubject with the fame indifference and abufe, they would long fince have loft (if not have ceafed to exift) that decided advantage which they now hold, over the civilized Races, in manly beauty and fymmetry of phyfical conformation; and that their Bills of Mortality would exhibit a much nearer approximation to those of civilized communities than they now do.\*

Befides the lift of fatal difeafes already given, and which I attribute chiefly to the pernicious habit which I have explained, there are other refults affedting the fenfes, perfonal appearance, and the enjoyments of life, which, though not *fatal*, are them-felves of fufficient importance to demand its correction; fuch as Curvature of the Spine, Idiocy, Deafnefs, Nightmare, Polypus in the Nofe, Malformation and premature decay of the teeth, toothache, tic-douloureux, Rheumatifm, Gout, and many others, to which the brute creations are ftrangers, and to most of which the Savage Races are but little fubjed.

By another reference to the Statistics of civilized Societies, we find that in *fome*, one half per cent. are Idiots or Lunatics; one-third per cent. are Deaf and Dumb, one half per cent. are hunch-backs, and from three-fourths to one per cent. of other difabling difeases and deformities; all of which are almost

<sup>\*</sup> I have before faid that the Brute creations are everywhere free from Cholera, Yellow fever, and other epidemics; yet they are as fubject as the human fpecies, to the effects of other poifons. Who knows until it is tried, how long a horfe, an ox, or a dog could exift in one of those infected districts, with its mouth fastened open, and its nostrils closed t

unknown to the American Native Races; affording a ftrong corroborative proof, if it were neceffary, that fuch deficiencies and deformities are the refults of accidents or habits, and not the works of Nature's hand.

Nature produces no difeafes, nor deformities; but the offfpring of men and women whole fyftems are impaired by the habits which have been alluded to, are no doubt oftentimes ufhered into the world with conftitutional weakneffes and predilections for contracting the fame habits, with their refults; and it is fafe to fay, that three-fourths of the generating portions of every civilized community exifting, are more or lefs under thefe difqualifications, which, together with want of proper care of their offspring, in infancy and childhood, I believe to be the caufe of four-fifths of the mental and phyfical deformities, lofs of teeth, and premature deaths, between conception and infancy, childhood, manhood, and old age.

I have faid that no difeafes are natural, and deformities, mental and phyfical, are neither hereditary nor natural, but purely the refults of accidents or habits. A cloven-foot produces no cloven-feet, hunch-backs beget ftraight fpines, and mental deformities can have no progeny.

What a fad bill to bring against the glorious advantages of civilized life, its *improvements*, its *comforts* and *refinements*, that in England there are fomething like 35,000 Idiots and Lunatics-17,000 Deaf and Dumb, and 15,000 hunch-backs, and about an equal proportion of these mental and physical deformities in the other civilized nations of the Earth!

Nature makes nothing without defign; and who dares to fay that fhe has defigned thefe lifts of pitiable existence amongst the civilized Races of Man, and that the more perfect work of her hand has been bestowed upon the Savage (and even the Brute) creations? And next to Nature, our *dear Mothers*, under whofe kind care and tender handling we have been raifed, could fubjest us to no accident to turn the brain or crook the fpine; but eafily and thoughtlessly might, even in their *over* anxiety for our health, fubjest us to early treatment, engendering habits which would gradually and imperceptibly produce the whole of these calamities; which I believe have never, as yet, been traced to a more probable cause than the habitual abuse of the lungs, in the manner which has been defcribed.

The teeth of Man, as with the Brutes, are wifely conftructed to answer their intended purposes through the natural term of life, and would so, no doubt, but from abuses, the principal one of which I confider to be the pernicious habit already explained. The faliva exuding from the gums, defigned as the Element of the teeth, floods every part of the mouth while it is shut; continually rising, like a pure fountain, from the gums, at the roots of and between the teeth; loosening and carrying off the extraneous matter which would otherwise accumulate, communicating difease to the teeth, and taint to the breath.

By nature, the teeth and the eyes are firstly *amphibious*; both immerfed in liquids which are prepared for their nourifhment and protection, and with powers of existing in the open air long enough for the various purposes for which they were defigned; but beyond that, abuse begins, and they foon turn to decay. It is the suppression of faliva, with dryness of the mouth, and an unnatural current of cold air across the teeth and gums during the hours of step, that produces malformation of the teeth, toothache, and tic-douloureux, with premature decay, and loss of teeth fo lamentably prevalent in the civilized world.

Amongst the Brute creations, that never open their mouths except for taking their food and drink, their teeth are protected from the air both day and night, and feldom decay; but with Man, who is a *talking* and *laughing* animal, exposing his teeth to the air a great portion of the day, and oftentimes during the whole of the night, the refults are widely different—he is oftentimes toothless at middle age, and in feven cases in ten, in his grave before he is fifty.

If civilized man, with his ufual derangements and abfence of teeth, had been compelled to crop the grafs, like the ox and the horfe, as the means of his living, and knew not the glorious ufe of the *Spoon*, to what a mifery would he have been doomed, and how long could he exift? the lofs of a tooth or two with thofe animals would refult in their death; and how wife, and how provident therefore, the defigns of the Creator, who has provided them with the unfailing means of fupporting their existence, and also the instinctive habits intended for the *protection* of those means.

Amongst the Native Races they feem to have a knowledge of these fasts; and the poor Indian woman who watches her infant and preffes its lips together as it seeps in its cradle attrasts the ridicule perhaps, or pity, of the passer-by, but secures the habit in her progeny which enables them to command the admiration and envy of the world.

These people, who talk little and sleep naturally, have no Dentists nor dentifrice, nor do they require either; their teeth almost invariably rife from the gums and arrange themselves as regular as the keys of a piano; and without decay or aches, preferve their soundness and enamel, and powers of massion, to old age: and there are no sufficient reasons affigned yet, why the fame refults, or nearly fuch, may not be produced amongst the more enlightened Races, by fimilar means.

Civilized man may properly be faid to be an open mouthed animal; a wild man is not. An Indian Warrior fleeps, and hunts, and fmiles, with his mouth fhut; and with feeming relutance, opens it even to eat or to fpeak. An Indian child is not allowed to fleep with its mouth open, from the very firft fleep of its existence; the confequence of which is, that while the teeth are forming and making their first appearance, they meet (and constantly *feel*) each other; and taking their relative, natural positions, form that healthful and pleasing regularity which has fecured to the American Indians, as a Race, perhaps the most manly and beautiful mouths in the World.\*

\* When I fpeak of comparative perfonal appearance or of the habits of a people, I speak of them collectively, and in the aggregate. I often see mouths and other phyfical conformations amongst the civilized portions of mankind equally beautiful as can be feen amongst the Savage Races, but by no means fo often. Symmetry of form, gracefulnefs of movement, and other conftituents of manly beauty are much more general amongst the Savage Races; and their Societies, free from the humbled and dependent mifery which comparative poverty produces in Civilized Communities, produce none of those striking contrasts which stare us in the face, and excite our difguft and our fympathies, at nearly every ftep we take. The American Savages are all poor, their higheft want is that of food, which is generally within their reach; their faces are therefore not wrinkled and furrowed with the ftamp of care and diftrefs, which extreme poverty begets-the repulsive marks which avarice engraves, nor with the loathfome and difgufting expressions " which the prodigal diffipations of Wealth often engender in Civilized Societies. Their taftes and their paffions are lefs refined and lefs ardent, and more feldom exerted, and confequently lefs abufed; they live on the fimples of life, and imagine and defire only in proportion; the confequences of which are, that their faces exhibit flighter inroads upon Nature, and confequently a greater average of good looks than an equal community of any civilized people.

Nature makes no derangements or deformities in teeth or mouths; but habits or accidents produce the difagreeable derangements of the one, and confequently the difgufting expressions of the other, which are fo often feen.

With the brute creations, where there is lefs chance for habits or accidents to make derangements, we fee the beautiful *fyftem* of the regularity of the works of Nature's hand, and in their foundnefs and durability, the *completenefs* of her works, which we have no just cause to believe has been stinted in the physical construction of man.

The contrast between the two Societies, of Savage and of Civil, as regards the perfection and duration of their teeth, is quite equal to that of their Bills of Mortality, already flown; and I contend that in both cafes, the principal caufe of the difference is exactly the fame, that of respiration through the mouth, during the hours of fleep.

Under the lefs cruel, and apparently more tender and affectionate treatment, of many civilized mothers, their infants fleep in their arms, in their heated exhalation, or in cradles, in overheated rooms, with their faces covered, without the allowance of a breath of vital air; where, as has been faid, they from neceffity gafp for breath until it becomes a habit of their infancy and childhood, to fleep with their mouths wide open, which their tender mothers overlook, or are not cruel enough to correft; little thinking of the fad affliction which the croup, or later difeafes are to bring into their houfe.

There is nothing more natural than a mother's near and fond embrace of her infant in her hours of fleep; and nothing more dangerous to its health, and even to its existence. The tender fympathies of love and inftinct draw her arms closer around it, and her lips nearer, as fhe finks into fleep and compels it to breathe the exhausted and poisoned air that fhe exhales from her own lungs; little thinking how much she is doing to break her heart in future days. Nothing is sweeter or more harmless to a mother than to inhale the seeble breath of her innocent; but she should be reminded that whils the is *drawing* these delicious draughts, she may be *returning* for them, pestilence and death.

All mothers know the painful, and even dangerous crifis which their infants pais in teething; and how naturally do their bofoms yearn for the fufferings of thefe little creatures whofe Earthly careers are often ftopped by that event. (3,660 per annum in England alone, under one year of age, as has been fhown.)

Amongst the Savage Races, we have seen that death seldom, if ever, ensues from this cause; and how easy it is to perceive that unnatural pains, and even death, may be caused by the habit of infants fleeping with their mouths strained open, and exposed to the cold air, when the germs of the teeth are first making their appearance.

The Statistics of England show an annual return of "25,000 infants, and children under five years of age, that die of *convulfions.*" What causes so probable for those convulsions as teething and the croup; and what more probable cause for the *unnatural* pains of teething and the croup, than the *infernal* habit which I am condemning.

At this tender age, and under the kind treatment just mentioned, is thoughtleffly laid the foundation for the rich harvests which the Dentists are reaping in most parts of the civilized world. The infant passes two-thirds of its time in sleep, with

its mouth open, while the teeth are prefenting themfelves in their tender flate, to be chilled and dried in the currents of air paffing over them, inflead of being nurtured by the warmth and faliva intended for their protection, when they project to unnatural and unequal lengths, or take different and unnatural directions, producing those diffagreeable and unfortunate combinations,

which are frequently feen in civilized adult focieties, and oftentimes fadly disfiguring the human face for life.

While there are a great many perfons in all civilized focieties who adhere to the defigns of Nature in the habits above referred to, how great a proportion of the individuals of those focieties carry on their faces the proofs of a different habit, brought from their childhood, which their Constitutions have fo far fuccefsfully battled agains, until (as has been faid) it becomes like a fecond Nature, and a matter of *neceffity*, even during their waking hours and the usual avocations of life, to breathe through the mouth, which is constantly open; while the nafal dusts, being vacated, like vacated roads that grow up to grafs and weeds, become the feat of Polypus and other difeafes.

In all of these instances there is a derangement and deformity of the teeth, and disfigurement of the mouth, and the *whole face*, which are not natural; carrying the proof of a long practice of the baneful habit, with its lasting consequences; and producing that unfortunate and pitiable, and oftentimes disgussing expression, which none but civilized communities can present.

Even the Brute creations furnish nothing to abominable as thefe; which justly demand our *sympathy* instead of our *derifion*. The faces and the mouths of the Wolf, the Tiger, and even the Hyena and the Donkey, are agreeable, and even handfome, by the fide of them.

What Phyfician will fay that the inhalation of cold air to the lungs through fuch mouths as thefe, and over the putrid fecretions and rotten teeth within, may not occasion difease of the lungs and death? Infected diftricts communicate difease----

infection attaches to putrescence, and no other infected distric can be so near to the lungs as an infected mouth.

Most habits against Nature, if not arrested, run into disease. The habit which has thus far been treated as a habit, merely, with its evil confequences, will here be feen to be worthy of a name, and of being ranked amongst the specific difeases of mankind; Indulged and practifed until the mouth is permanently diftorted from its natural fhape, and in the infectious flate above named, acting the unnatural hand-maid to the lungs, it gains the locality and fpeciality of character which characterize difeafes, and therefore would properly rank amongst them. No name feems as yet to have been applied to this malady, and no one apparently more expressive, at prefent fuggests, than Malo inferno, which (though perhaps not exactly Claffic) I would denominate it, and define it to be strictly a human difease, confined chiefly to the Civilized Races of Man, an unnatural and pitiable disfigure ment of the "human face divine," unknown to the Brutes, and unallowed by the Savage Races, caufed by the carelefs permiffion of a habit contracted in infancy or childhood, and fubmitted to, humbly, through life, under the miltaken belief that it is by an unfortunate order of Nature-its Remedy (in neglect of the fpecifics to be proposed in the following pages) the grave (generally) between infancy and the age of forty.

The American Indians call the civilized Races "*pale faces*" and "*black mouths*," and to understand the full force of these expressions, it is necessfary to live awhile amongst the Savage Races, and then to return to civilized life. The Author has had ample opportunities of testing the justness of these expressions, and has been forcibly struck with the corredness of their application, on returning from Savage to Civilized Society. A long familiarity with red faces and clofed mouths affords a new view of our friends when we get back, and fully explains to us the horror which a favage has of a "pale-face," and his difguft with the expression of open and *black mouths*.\*

No man or woman with a handfome fet of teeth keeps the mouth habitually open; and every perfon with an unnatural derangement of the teeth is as fure feldom to have it flut. This is not becaufe the derangement of the teeth has made the habit, but becaufe the habit has caufed the derangement of the teeth.

If it were for the fake of the teeth alone, and man's perfonal appearance, the habit I am condemning would be one well worth ftruggling against; but when we can so easily, and with so much certainty discover its destructive effects upon the *conftitution* and *life* of man, it becomes a subject of a different importance, and well worthy of being understood by every member of society, who themselves, and not physicians, are to arress its deadly effects.

The Brute, at its birth, rifes on its feet, breathes the open air, and feeks and obtains its food at the next moment.

\* Of the party of 14 Ioway Indians, who vifited London fome years fince, there was one whofe name was Wafh-ke-mon-ye (the faft dancer); he was a great droll, and fomewhat of a critic; and had picked up enough of Englifh to enable him to make a few fimple fentences and to draw amufing comparifons. I afked him one day, how he liked the White people, after the experience he had now had; to which he replied—" Well, White man—fuppofe—mouth flut, putty coot, mouth open, no coot—me no like um, not much." This reply created a fmile amongft the party, and the chief informed me that one of the moft ftriking peculiarities which all Indian Tribes difcovered amongft the white people, was the derangement and abfence of their teeth, and which they believed were deftroyed by the number of ies that paffed over them.

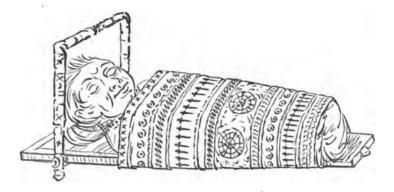

The Chicken breaks its own fhell and walks out on two legs, and without a gaze of wonder upon the world around, begins felefting and picking up its own food !

Man, at his birth, is a more helpless animal, and his mental, as well as his physical faculties, requiring a much longer time to mature, are subject to greater dangers of misdirection from pernicious habits, which it should be the first object of parents to guard against.

The Savage Tribes of America allow no obftacles to the progress of Nature in the development of their teeth and their lungs for the purposes of life, and consequently securing their exemption from many of the pangs and pains which the civilized Races seem to be heirs to; who undoubtedly too often *over*-educate the *intellest*, while they *under*-educate the *Man*.

The human infant, like the infant brute, is able to breathe the natural air at its birth, both alleep and awake; but that breathing fhould be done as Nature defigned it, through the noftrils, inftead of through the mouth.

The Savage Mother, inftead of embracing her infant in her fleeping hours, in the heated exhalation of her body, places it at her arm's length from her, and compels it to breathe the frefh air, the coldnefs of which generally prompts it to fhut the mouth, in default of which, she preffes its lips together in the manner that has been flated, until fhe fixes the habit which is to laft it through life; and the contraft to this, which is too often practifed by mothers in the civilized world, in the miflaken belief that *warmth* is the effential thing for their darling babes, I believe to be the innocent foundation of the principal, and as yet unexplained caufe of the deadly difeafes fo frightfully fwelling the Bills of Mortality in civilized communities. All Savage infants amongst the various native Tribes of America, are reared in cribs (or cradles) with the back lashed

to a ftraight board; and by the aid of a circular, concave cufhion placed under the head, the head is bowed a little forward when they fleep, which prevents the mouth from falling open; thus eftablifhing the early habit of breathing through the noftrils. The refults of this habit are, that Indian adults invariably walk ereft and ftraight, have healthy fpines, and fleep

upon their backs, with their Robes wrapped around them; with the head fupported by fome reft, which inclines it a little forward, or upon their faces, with the forehead refting on the arms

which are folded underneath it, in both of which cafes there is a tendency to the clofing of the mouth; and their fleep is therefore always unattended with the nightmare or fnoring.

Lying on the back is thought by many to be an unhealthy practice; and a long habit of fleeping in a different polition may even make it fo; but the general cultom of the Savage races, of fleeping in this polition from infancy to old age, affords very conclusive proof, that if commenced in early life, it is the healthieft for a general politure, that can be adopted.

It is very evident that the back of the head fhould never be allowed, in fleep, to fall to a level with the fpine; but fhould be fupported by a fmall pillow, to elevate it a little, without raifing the fhoulders or bending the back, which fhould always be kept ftraight.

The Savages with their pillows, like the birds in the building of their nefts, make no improvements during the lapfe of ages, and feem to care little if they are blocks of wood or of ftone, provided they elevate the head to the required position.

With the civilized Races, where everything is progreffive, and luxuries effectially fo, pillows have increased in longitudinal dimensions until they too often form a support for the shoulders as well as the head, thereby annulling the object for which they were originally intended, and for which, alone, they fhould be ufed.

All animals lower the head in fleep; and mankind, with a fmall fupport under it, inclining it a little forward, affume for it a fimilar position.

This elderly and excellent Gentleman, from a long (and

therefore neceffary) habit, takes his nap after dinner, in the attitude which he is contented to believe is the most luxurious that can be devifed; whilst any one can discover that he is very far from the adual enjoyment which he might feel, and the more agreeableness of aspest which he might present to his furrounding friends, if his invention had carried him a little farther, and suggested the introduction of a small cushion behind his head, advancing it a little forward, above the level of his spine. The gastric juices commence their work upon the fresh contents of a stomach, on the arrival of a good dinner, with a much flighter

jar upon the digeftive and nervous fystems, when the foothing and delectable compound is not fhocked by the unwelcome inhalations of chilling atmosphere.

And this tender and affectionate Mother, *bleffing* herfelf and her flock of little ones with the *pleafures of fleep*! how much

might fhe increase her own enjoyment with her pillow under her *head*, instead of having it under her *s*, and that of her little gasping innocents, if she had placed them in cribs, and with pillows under their heads, from which they could not escape.

The contrast between the expressions of these two groups

will be ftriking to all; and every mother may find a leffon in them worth her ftudying; either for improvements in her own Nurfery, or for teaching those who may ftand more in need of Nurfery Reform than herfelf.

So far back as the ftarting point in life, I believe man feldom looks for the caufes of the pangs and pains which befet and torture him in advanced life; but in which, far back as it may be, they may have had their origin.

Little does he think that his aching, deformed, and decaying teeth were tortured out of their natural arrangement and health, in the days of their formation, by the cold draughts of air acrofs them; or that the confumption of his decaying lungs has been caufed by the fame habit; and that habit was the refult of the adual tendernefs, but overfight, of his affedionate *Mother*, when he flept in her arms, or in the cradle.

The foregoing are general remarks which I have been enabled to make, from long and careful obfervation; and there are others perhaps, equally or more demonstrative of the danger of the habit alluded to, as well as of the power we have of averting it, and of arresting its baneful effects, even in middle age, or the latter part of man's life, which will be found in the relation of my own experience.

At the age of 34 years, (after devoting myfelf to the dry and tedious fludy of the Law for 3 years, and to the practice of it for 3 years more, and after that to the ftill more fatiguing and confining practice of Miniature and portrait painting, for 8 years,) I penetrated the vaft wilderness with my canvass and brushes, for the purpose which has already been explained; and in the prosecution of which defign, I have devoted most of the subsequent part of my life.

from day to day from the ravages of this infidious enemy that preys upon their lungs in their unconfcious moments, who know not the caufe of their fufferings, and find not the Phyfician who can cure them.

Finding myfelf to evidently relieved from the painful and alarming refults of a habit which I recollected to have been brought from my boyhood, I became forcibly ftruck with the cultom I had often observed (and to which I have before alluded) of the Indian women preffing together the lips of their fleeping infants, for which I could not, at first, imagine the motive, but which was now fuggested to me in a manner which I could not mifunderstand; and appealing to them for the object of fo, apparently, cruel a mode, I was foon made to understand, both by their women and their Medicine Men, that it was done "to enfure their good looks, and prolong their lives;" and by looking into their communities, and contrasting their fanitary condition with the Bills of Mortality amongst the civilized Races, I am ready to admit the justness of their reply; and am fully convinced of the advantages those ignorant Races have over us in this refpect, not from being ahead of us, but from being behind us, and confequently not fo far departed from Nature's wife and provident regulations, as to lofe the benefit of them.

From the whole amount of obfervations I have made amongst the two classes of fociety, added to my own experience, as explained in the foregoing pages, I am compelled to believe, and feel authorifed to affert, that a great proportion of the difeases prematurely fatal to human life, as well as mental and physical deformities, and destruction of the teeth, are caused by the abuse of the lungs, in the Mal-respiration of Sleep: and alfo, that the pernicious habit, though contracted in infancy or childhood, or manhood, may generally be corrected by a fleady and determined perfeverance, bafed upon a conviction of its baneful and fatal refults.

The great error is most frequently committed, and there is the proper place to correct or prevent it, at the *flarting point* when the germs are tender, and taking their first impressions, which are to last them through life. It is then too, that the fondess and tenderess fympathies belonging to the human breass are watching over them; and it is only necessary for those kind guardians to be made aware of the danger of thoughtless habits which their over-indulgence may allow their offspring to fall into.

It is to *Mothers*, and truly not to Phyficians or Medicines, that the world are to look, for the remedy of this evil; and the phyfical improvements of mankind, and the prolongation of human existence, effected by it.

Children, I have faid, are not born *Hunch-backs*, but a habit of fleeping thus, in the varying temperatures of the night,

might make them fuch. Infants are not born Idiots or Lunatics,

but a habit of fleeping thus, in fudden changes of weather,

would tend to make them fo, and in the countries where infants fleep thus, the above deformities fcarcely exift; while in Eng-

land, as has been flown, there are 20,000 of the first of these, and 35,000 of the latter. How fignificant and important the deductions from these fimple facts—if they be facts—and who will contradict them?

If Phyficians and Surgeons gain fame for occafionally conquering the enemy in *combat*; what laurels, and what *new Title*, fhould await the *fair Diplomatifts* who will *keep the enemy out of the field*—the affectionate *mothers*, who, like the Indian woman, will fit by their fleeping infants, and watch and guard them through their childhood, against the departure from one of Nature's most wife and important regulations, defigned for their health and happines.

If the great majority of this fort of evil has its origin in that early period of life, its correction comes directly under the Mother's province; and there certainly can be no better gua-

rantee for the benefit of coming generations, than that mothers fhould be made fully fenfible of the evil, and of their own power to avert it. And TO Mothers, I would in the first place, say, for the fakes of your infants unborn, and for your own lives' sake, draw the curtain, (not of your bed, but of your lungs) when you retire to reft; availing yourfelves and your offspring of the full benefit of the peaceful and invigorating repose which Nature has prepared for you, to enable you to meet with fuccefs the events to which you are approaching; and when Nature has placed in your arms for your kind care, the darling objects of your tenderest affections, not to forget that fhe has prepared and defigned them to breathe the open air; and that when they fleep in your embrace in heated rooms and feather beds, they fleep in a double or treble heat, the thoughtlefs confequences of which will be likely to break your hearts in future life. Rest affured that the great secret of life is the breathing principle, for which Nature has rightly prepared the material, and the proper mode of using it; and at the incipient stage of life where Mothers are the Physicians, is the easiest place to contract habits against Nature, or to correct them; and that there is woman's post, her appropriate sphere; where she takes to herfelf the fweetest pleasures of her existence, and draws the highest admiration of the World, whilft, like a guardian Angel, the is watching over, and giving direction to, the Deftinies of Man.

To Children—to Boys and Girls, who have grown up to the age of difcretion, and are able to read, the above information and advice are doubly important, becaufe you have long lives of enjoyment or mifery before you; and which, you now being out of your Mother's immediate care, are to be controlled by your own actions. And that you may not undervalue the advice which I am about to advance directly to you, I may (as the Clergyman repeats his text in his Sermon, or a fond parent, the important points of his advice to his fon) repeat fome things that I have faid, while I am giving you *further* evidence of the importance of the fubject I am now explaining to you.

I advife you to bear in mind the awful Bills of Mortality amongft civilized focieties, which I have quoted; and realize the dangerous race which civilized man runs in life—how very few live to the age defigned by Nature—how many perifh in infancy, long before they are of your age; and confequently the dangers which you have already paffed, and contraft all of thefe with those of the Wild Indians, who by Nature, are no stronger than we are, but who generally live to good old age, with comparatively, few bodily pains in life, and their teeth almost uniformly regular and found, without the aid of Dentists and tooth-brfhues.

Have you observed by those Bills of Mortality, that you are but one out of two or three of your little companions who started and commenced playing along with you, permitted to live to boyhood; and also that you have but one chance in four, or thereabouts, of living to tolerable old age?

Can you read those lamentable estimates, which are matters of fast, and draw such fearful conclusions from them as to your own condition and prospects, without realizing the importance of the subject? and can you compare those disasters amongst the civilized, with those of the Savage Races, which I have explained, without believing there is some cause for all this, that is unnatural, and which may be, to a great degree, corrected, if we make the proper effort?

## THE BREATH OF LIFE.

You have read in the foregoing pages, that man's life depends from one moment to another on the air which he breathes, and alfo that the atmosphere is nowhere pure enough for the healthy use of the lungs until it has paffed the purifying process which Nature has prepared in the nostrils, and which has been explained. Air is an Elementary principle, created by the hand of God, who, as has been faid, creates nothing but perfections; and consequently is nowhere impure, except from the causes which I have already explained; and in the infinity of His wisdom and goodness, those accidental impurities were foressen and provided for (even with the brutes, as well as with Mankind), by the mysterious organizations through which the breath of life first came to man.

The various occupations of men, and for which you are by this time preparing, fubject them more or lefs to the dangerous effects of the malaria and poifonous particles in the air, in proportion to the nature of their employments, and the diftricts and atmospheres in which they exist and work.

The Mechanical trades are the most fubjest to these, from which the farmer and the Gentleman are more exempt; the Carpenter, therefore, amidst the dust of his shop, should work with his mouth shut, and take care not to sleep upon his bench during his mid-day rest. The Cutlery grinder should not work with his mouth open amidst the particles of steel which his feet raise from the floor, and the motion of his wheel keeps in circulation in the air.

So with the Stone-cutter (and particularly those working in the hardest fort of stones and flint) the same precautions are neceffary; as by the extraordinary proportion of deaths Reported amongst those classes of workmen, the poisonous effects of their bufinels are clearly proved, as well as by the accumulated particles of iteel and filex found imbedded in their lungs and coating the Refpiratory organs; and which, to have caufed premature death, muft have been inhaled through the *mouth*. Phyficians are conftantly informing the world, in their Reports, of the fatal refults of these possion things inhaled into the lungs; but why do they not fay at the fame time, that there are two modes of inhalation, by the *nose* and by the *mouth*; and inform the Mechanics and labourers of the World who are thus risking their lives, that there is fasty to life in one way, and great danger in the other? If Phyficians forget to give you this advice, these fuggestions, with your own difcretion, may be of fervice to you.

The Savages have the advantage of moving about, and fleeping in the open air; and Civilized Races have the advantages over the poor Indians, of comfortable houfes and beds, and bed-rooms; and also of the most skilful Physicians, and Surgeons, and Dentists; and still we are struck with the deplorable results in our society, of some latent cause of diseases, which I believe has been too much overlooked and neglested.

Have you not many times waked in the middle of the night, in great diffrefs, with your mouths wide open, and fo cold and dry that it took you a long time to moiften and fhut them again? and did it occur to you at those moments that this was all the refult of a careless habit, by which you were drawing an unnatural draught of cold air in every breath, directly on the lungs, instead of drawing it through the nostrils, which Nature has made for that especial purpose, giving it warmth, and measuring its quantity, fuitable to the demands of repose? Watch your little Brothers and Sifters, or other little innocent playfellows, when afleep with their mouths ftrained open. and observe the painful expressions of their faces—their ner

vous agitation—the unnatural beating of their hearts—the twitching of their flefh, and the cords of their necks and throats; and your own reafon will tell you that they do not enjoy fuch fleep. And on the other hand, what pictures of innocence and enjoyment are those who are quietly fleeping with their mouths firmly flut, and their teeth closed, finiling as they are enjoying

their natural repose? If you will for a few moments thut your eyes, and let your under jaw fall down, as it fometimes loes in your fleep, you will foon fee how painful the over draught of cold air on the lungs becomes, even in the day-time, when all your energies are in action to relieve you; and you will inftantly perceive the mifchief that fuch a mode of breathing might do in the night, when every mufcle and nerve in your body is relaxed and feeking repofe, and the chill of the midnight air is increasing.

It is, most undoubtedly, the above named habit which produces *confirmed Snorers*, and also confumption of the lungs and many other difeases, as well as premature decay of the teeth the Nightmare, &c., from which it has been shown, the Savage Races are chiefly exempt; and (I firmly believe) from the fast that they always sleep with their mouths closed, and their teeth together, as I have before described.

There are many of you who read, to whom this advice will not be neceffary, while many others of your little companions will attract your fympathy when you fee them afleep, with their mouths strained open, and their sensations anything but those of joy and rest. Their teeth are growing during those hours,

and will grow of unequal lengths, and in unnatural directions, and oftentimes difabling them in after life, from flutting their

mouths, even in their waking hours, and most lamentably disfiguring their faces for the remainder of their days.

It is then, my young Readers, for you to evade these evils, to fave your own lives and your good looks, by *your own* efforts, which I believe the most of you can do, without the aid of Physicians or Dentist, who are always the ready and bold antagonists of difease, but never called until the enemy has made the attack.

I imagine you now just entering upon the stage of life, where you are to come under the gaze of the world, and to make those impressions, and form those connexions in society which are to attend you, and to benefit or to injure you through life. You are just at that period of your existence when the proverb begins to apply, that "man's life is in his own hands;" and if this be not always true, it is *quite true*, that much of his good looks, his daily enjoyments, and the control of his habits, are within the reach of his attainment. These are all advantages worth striving for, and if you sternly perfevere for their accomplishment, you will perfectly verify in your own cases, the other and truer adage, that "at middle age, man is his own best Physician."

I recollect, and never fhall forget while I live, that in my boyhood, I fell in love with a charming little girl, merely becaufe her pretty mouth was always fhut; her words, which were few, and always (I thought) fo fitly fpoken, feemed to iffue from the centre of her cherry lips, whilft the corners of her mouth feemed (to me,) to be honeyed together. No excitements could bring more than a fweet fmile on her lips, which feemed to hold confident guard over the white and pretty treafures they enclofed, and which were permitted but occafionally, to be feen peeping out.

Of fuch a mouth it was eafy to imagine, even without feeing

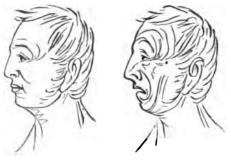

them, the beautiful embellifhments that were within, as well as the fweet and innocent expression of its repose, during the hours of sleep; and from such impressions, I recollect it was exceedingly difficult and painful to wean my boyish affections.

To young people, who have the world before them to choofe in, and to be chofen; next to the importance of life itfelf, and their *Future* welfare, are the habits which are to disfigure and impair, or to beautify and protect that feature which, with man and with woman, alike, is the most expressive and attractive of the face; and at the fame time, the most fubject to the influence of pleasing, or difagreeable, or difgusting habits.

Good looks and other perfonal attractions are defirable, and *licenfed* to all; and much more generally attainable than the world fuppofe, who take the various features and expressions which they fee in the multitude, as the works of Nature's hand.

The natural mouth of man is always an expressive and agreeable feature; but the departures from it, which are caused by the predominance of different passions or tastes, or by the perfectly infipid and disgusting habit which has been explained, are anything but agreeable, and but little in harmony with the advance of his intellect.

Open mouths during the night are fure to produce open mouths during the day; the teeth protrude, if the habit be commenced in infancy, fo that the mouth can't be flut, the natural expression is lost, the voice is affected, polypus takes posses of the nose, the teeth decay, tainted breath ensues, and the lungs are destroyed. The whole features of the face are changed, the under jaw, unhinged, falls and retires, the cheeks are hollowed, and the cheek-bones and the upper jaw advance, and the

## Nature

changed by habit.

brow and the upper eyelids are unnaturally lifted; prefenting at once, the leading features and expression of *Idiocy*.

Thefe are changes in the contour and expression of the face which any one can sufficiently illustrate, with a little effort, on his own face before a looking-glass; and that these results are often fixed and permanently retained in fociety, every fane perfon is able to discover; and I believe most perfons will agree with me, that they are the unfortunate results of the habit I am denouncing.

All the World judge of men's difpofitions and character by the expressions of their face; and how difastrous may it therefore be for men to indulge an expression of face in their sleep which they would be assumed of in their waking hours? The world is full of such, however, and such a man assume, and a sleeping Idiot, are exactly the same.

How appalling the thought, and dangerous the habit! and what are likely to be the refults flown in the fixed and lafting expressions of the face?

These remarks, and these questions are intended for Boys and Young Men, for I can scarcely allow myself to believe that Young Ladies would be caught fleeping thus; but one word of advice, even to them, may not be amiss—Idiots asleep cannot be Angels awake.

The natural mouths of mankind, like those of the brutes, have a general fystematic form and expression; but the various habits and accidents of life give them a vast variety of expressions; and the greater portion of those deviations from Nature, are caused by the malformation of the teeth, or by the falling of the under jaw, which alone, in its intended polition, forms the natural mouth. When formed in this way, and unchanged by habit or accident, the mouth is always well-fhaped and agreeable; but if the teeth become deranged in the manner I have defcribed, the mouth becomes deformed; and in endeavouring to hide that deformity, oftentimes more difagreeable and unnatural than when that deformity is exposed.

I knew a young Lady many years ago, amiable and intelligent; and agreeable in everything excepting the unfortunate derangement and fhapes of her teeth; the front ones of which, in the upper jaw, protruding half an inch or more forward of the lower ones, and quite incapable of being covered by the lip, for which there was a conftant effort; the refult of which was a most pitiable expression of the mouth, and confequently of the whole face, with continual embarraffment and unhappinefs of the young Lady, and fympathy of her friends. With all the other charms requifite to have foothed and comforted the life of any man, fhe lived a life of comparative folitude; and a few years fince, after a lapfe of 30 years, I met her again; and though in her old age, fhe was handfome,-her teeth were all gone, and her lips, from the natural fweetnefs and ferenity of her temper, feemed to have returned to their native and childifh expression, as if making up for the unnatural and painful fervitude they had undergone.

The human mouth, with the great variety of duties it has to perform, is fubject to a fufficient variety of expressions and distortions from abuse, independent of those arising from the habit I am condemning.

í

The Ear, the Nofe, and the Eyes, being lefs mutable, and lefs liable to change of character and fhapes, feldom lofe their

natural expression; while original nature is as feldom feen remaining in the expression of the adult mouth.

This feature, from the variety of its powers and uses, as well as expressions, is undoubtedly the greatest mystery in the *material* organization of man. In infant Nature it is always innocent and sweet, and sometimes is even so in adult life.

Its endlefs modulations of found may produce the richeft, the fweeteft of mufic, or the moft frightful and unpleafant founds in the world. It converfes, it curfes, and applauds; it commends and reproves, it flanders, it flatters, it prays and it profanes, it blafphemes and adores—blows hot and blows cold fpeaks foft tones of love and affection, and rough notes of vengeance and hatred; it bites, and it woos—it kiffes, ejects faliva, eats cherries, Roaft Beef, and Chicken, and a thoufand other things—drinks coffee, gin, and Mint-juleps (and fometimes Brandy), takes pills, and Rhubarb and Magnefia—tells tales, and keeps fecrets, is pretty, or is ugly, of all fhapes, and of all fizes, with teeth white, teeth black, and teeth yellow, and with no teeth at all.

During the *day*, it is generally eating, drinking, finging, laughing, grinning, pouting, talking, fmoking, fcolding, whiftling, chewing, or fpitting, all of which have a tendency to keep it open; and if allowed to be open during the *night*, is feen, as has been defcribed, by its derangement of the teeth, to create thereby, its own worft deformity.

How strange is the fast, that of the three creations—the Brute, the Savage, and the Civilized Races—the studies and irrational are taught to perfectly protest and preferve their teeth,
through the natural term of life; the ignorant, Savage Races of mankind, with judgment enough *comparatively* to do fo; when

enlightened man, with the greatest amount of knowledge, of pride, and conceit in his good looks, lacks the power to fave them from premature decay, and total destruction? Showing, that in the enjoyment of his artificial comforts and pleasures, he destroys his teeth, his good looks, and often his life, in his thoughtlefs departure from natural simplicities and instinct.

The Young Readers, whom I imagine myfelf now addrefsing, are old enough to read my advice, and to understand it, and confequently able to make, and to perfevere in, their own determined refolutions, which will be fure to conquer in the end, the habit alluded to, if it has already been allowed to grow upon them.

I advife you to turn back and read again, unlefs you can diffindly recollect it, the perfect succefs that I met with in my own cafe, even at a far more advanced age, and confequently the habit more difficult to correct; and refolve at every moment of your waking hours (except when it is *neceffary* to open them) to keep your lips and teeth firmly preffed together; and your *teeth*, at all events, under any and every emotion, of pain or of pleafure, of fear, of furprife, or admiration; and from a continual habit of this fort, which will prepare you to meet more calmly and coolly the ufual excitements of life, you will find it extending through your fleeping hours, if you will clofe your lips and your eyes in the fixed determination, and effectually correcting or preventing the difgufting and dangerous habit of fleeping with the mouth open.

Not only manly beauty is produced, and manly firmnels of character expressed by a habitual compression of the lips and teeth; but courage, steadinels of the nerves, coolnels, and power . are the infallible refults.

Men who have been josted about amongst the vicifitudes of a long life, amidst their fellow men, will have observed that all nervousness commences in the mouth. Men who lack the courage to meet their fellow men in physical combat, are afraid, not of their enemy, nor from a convision of their own inferiority, but from the *disarming* nervousness of an open and tremulous mouth; the vibrations of which reach and weaken them, to the ends of their fingers and their toes. In public debates—in the Forum or the Pulpit, a fimilar alarm refults in their certain defeat; and before a hive of Bees, in the fame want of confidence, the *odour* of *fear* which they emit, is fure to gain them the sting.

In one of the exciting fcenes of my roaming life, I recolleft to have witneffed a ftrong illustration of the above remarks, while refiding in one of the Sioux Villages, on the banks of the upper Miffouri. A ferious quarrel having arisen between one of the Fur Company's men and a Sioux Brave, a challenge was given by the Indian and accepted by the White Man, who were to meet upon the prairie, in a flate of nudity, and unattended; and decide the affair with their knives.

A few minutes before this horrible combat was to have commenced, both parties being on the ground, and perfectly prepared, the Factor and myfelf fucceeded in bringing them to a reconciliation, and finally to a fhaking of hands; by which we had the fatisfaction of knowing, beyond a doubt, that we had been the means of faving the life of one of thefe men; and a fhort time afterwards, while alone with the Indian, I afked him if he had not felt fears of his antagonift, who appeared much his fuperior in fize and in ftrength—to which he very promptly replied—" no, not in the leaft; I never fear harm from a man who can't flut his mouth, no matter how large or how firong he may be." I was forcibly flruck with this reply, as well as with he conviction I had got in my own mind (and no doubt from the fame fymptoms) that the white man would have been killed, if they had fought.

That there is an unnatural and lafting *contour*, as well as an expression of ugliness and lack of manly firmness of charafter produced in the human face by the habit I have deferibed, every differing member of fociety is able easily to decide.

No one would hefitate a moment in deciding which of these he would have the most reason to fear in battle, or which to choose as his Advocate, for the protection of his life or his property.

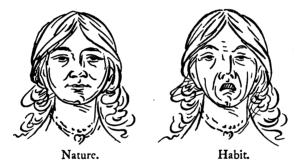

No young Lady would delay a moment, in faying which of thefe, in her estimation, is the best looking young man; or deciding (in her own mind) which of them she would prefer for her Suitor, provided she were to take either.

No one would hefitate in deciding which of these horses to buy (provided the poor Brutes were visitims to such missfortunes).

THE BREATH OF LIFE.

And no one, most affuredly, so poor a Physiognomist as not to decide in a moment, which of these young Ladies was the most happy, and which would be likely to get married the first;

and from these innocent and helpless startings in life, it is easy to perceive how man's best success, or first and worst missfortunes are foreshadowed, and the fond mother, whilst she watches, in thoughtless happiness, over her sleeping idol, may read in that little open mouth, the certain index to her future forrows.

It has already been faid that man is an "open mouthed animal," and alfo fhown that he is only fo by *habit*, and not by *Nature*; and that the most striking difference which is found to exist between Mankind in Savage and Civil states, confists in that habit and its confequences, to be found in their relative fanitary conditions.

The American Savage often *finiles*, but feldom *laughs*; and he meets most of the emotions of life, however fudden and exciting they may be, with his lips and his teeth closed. He is, nevertheless, garrulous and fond of anecdote and jocular fun in his own firefide circles; but feels and expresses his pleasure without the explosive action of his muscles, and gesticulation, which characterize the more cultivated Races of his fellow men

Civilized people, who, from their educations, are more excitable, regard most exciting, amufing, or alarming fcenes with the mouth open; as in wonder, astonishment, pain, pleasure, listening, &c., and in *laughing*, draw pleasure in currents of air through their teeth, by which they insure (perhaps) pain for *them felves*, in their fober moments, and for their *teeth*, diseases and decay which no Dentists can cure.

The Savage, without the change of a muscle in his face, listens to the rumbling of the Earthquake, or the thunder's crash, with his hand over his mouth, and if by the extreme of other excitements he is forced to laugh or to cry, his mouth is invariably hidden in the fame manner.

As an illustration of fome of the above remarks, perhaps "Punch and Judy," which is generally as apt as any other exciting fcene to unmask the juveniles, may with effect be alluded to for contrast of expression, as familiar in our streets, or as it

would be viewed by an equal multitude of favage chil dren.

It is one of the misfortunes of Civilization, that it has too many amufing and exciting things for the mouth to fay, and too many delicious things for it to tafte, to allow of its being clofed during the day; the mouth, therefore, has too little referve for the protection of its natural purity of expression; and too much exposure for the protection of its garniture; and, ("good advice is never too late") keep your mouth shut when you *read*, when you *write*, when you *listen*, when you are in pain, when you are *walking*, when you are *running*, when you are *riding*, and, by all means, when you are *angry*. There is no person in fociety but who will find, and acknowledge, improvement in health and enjoyment, from even a *temporary* attention to this advice.

Mankind, from the caufes which have been named, are all, more or lefs invalids, from infancy to the end of their lives; and he who would make the moft of life under thefe neceffary ills; fecure his good looks, and prolong his exiftence; fhould take care that his lungs and his teeth, however much they may be from habit, or from neceffity, abufed during the day, fhould at leaft be treated with kindnefs during the night.

The habit against which I am contending, when strongly contrasted, I am fully aware, is a difficult one to correct; but when you think feriously of its importance, you will make your resolutions fo strong, and keep them with such fixed and determined perfeverance, that you will be sure to succeed in the end.

If you charge your minds during the day fufficiently ftrong, with any event which is to happen in the middle of the night, you are fure to wake at, or near the time; and if fo, and your minds dwell, with fufficient attention, on the importance of this fubject during the day, and you close your eyes and your teeth at the fame time, carrying this determination into your fleep, there will be a ftrong monitor during your reft, that your mouth muft be fhut; and the benefits you will feel during the following day, from even a partial fucces, will encourage you to perfevere, until at last, the grand and important object will be accomplished.

One fingle fuggestion more, Young Readers, and you will be ready to be your own Physicians, your own protectors against the horrors of the Nightmare, Snoring, and the dangerous difeases above described.

When you are in a theatre, you will obferve that most perfons in the pit, looking up to the gallery, will have their mouths wide open; and those in the gallery, looking down into the pit, will be as fure to have their mouths shut. Then, when you lay your head upon your pillow, advance it a little forward, so as to imagine yourself looking from the Gallery of a Theatre into the Pit, and you have all the fecrets, with those before mentioned, for dispelling from you the most abominable and destructive habit that ever attached itself to the human Race.

To *Men* and *Women*, of maturer age and experience, the fame advice is tendered; but with them the habit may be more difficult to correct; but with all, it is worth the trial, becaufe there is no poffibility of its doing any harm, and it cofts nothing.

For the greater portion of the thousands, and *tens* of thoufands of perfons fuffering with weakness of lungs, with Bronchitis, Asthma, indigestion, and other affections of the Digestive and Respiratory organs, there is a *Panacea* in this advice too valuable to be disregarded, and (generally) a relief within their own reach, if they will avail themselves of it.

Approach the bedfides of perfons fuffering under either of

the above dangerous difeafes, and they will be found to be fleeping with their mouths wide open, and working their lungs with an over-draught of air upon them, and fubject to its midnight changes of temperature as the fires go down; and thus nightly renewing and advancing their difeafes which their Phyficians are making their daily efforts in vain to cure.

To fuch perfons my ftrongest fympathy extends, for I have fuffered in the fame way; and to them I gladly, and in full confidence of its beneficial refults, recommend the correction of the habit, in the way I have defcribed; their stern perfeverance in which will foon afford them relief; and their first night of natural sleep will convince them of the importance of my advice.

Man's life (in a certain fenfe) may be faid to "be in his own hands," his body is always clofely invefted by difeafes and death. When awake, he is ftrong, and able to contend with, and keep out his enemies; but when he is afleep he is weak; and if the front door of his houfe be then left open, thieves and robbers are fure to walk in.

There is no harm in my repeating that Mothers fhould be looked to as the first and principal correctors of this most destructive of human habits; and for the cases which escape their infant cares, or which commence in more advanced stages of life. I have pointed out the way in which every one may be his or her Physician; and the united and simultaneous efforts of the Civilized World should also be exerted in the overthrow of a Monster so destructive to the good looks and life of man. Every Physician should advise his patients, and every Boarding School in existence, and every hospital, should have its furgeon or matron, and every Regiment its Officer, to make their

nightly, and *hourly*, "rounds," to force a ftop to fo unnatural, difgufting, and dangerous a habit.

Under the working of fuch a fystem, mothers guarding and helping the helples, Schoolmasters their scholars, hospital furgeons their patients, Generals their soldiers, and the rest of the world protecting themselves, a few years would show the glorious results in the Bills of Mortality, and the next generation would be a *Re-generation* of the Human Race.

The Reader will have difcovered, that in the foregoing remarks (unlike the writer of a Play or a Romance, who follows a *plan* or a *plot*) I have aimed only at jotting down, with little arrangement, fuch facts as I have gained, and obfervations I have made, in a long and laborious life; on a fubject which I have deemed of valt importance to the human Race; and which, from a *lenfe* of *duty*, I am now tendering to my fellow beings, believing, that if fufficiently read and appreciated, thousands and tens of thousands of the human family may, by *their own* efforts, refcue their lives, and those of their children, from premature graves.

And in doing this, I take to myfelf, not only the fatisfaction of having performed a *politive duty*, but the *confolations*, that what I have proposed can be tried by all claffes of fociety alike, the Rich and the Poor, without pain, without medicine, and without expense; and also, that thousands of fuffering wanderers in the wilderneffes and malaria of foreign lands, as well as of those in the midst of the luxuries of their own comforta bl homes, will privately thank me in their own hearts, for hints they will have got from the foregoing pages.

The Proverb, as old and unchangeable as their hills, amongft

the North American Indians: "My fon, if you would be wife, open first your Eyes, your Ears next, and last of all, your Mouth, that your words may be words of wisdom, and give no advantage to thine adversary," might be adopted with good effect in Civilized life; and he who would strictly adhere to it, would be fure to reap its benefits in his waking hours; and would foon find the habit running into his hours of rest, into which he would calmly enter; disfinis the nervous anxieties of the day, as he firmly closed his teeth and his lips, only to be opened after his eyes and his ears, in the morning; and the rest of fuch fleep would bear him *daily* and *hourly* proof of its value.

And if I were to endeavour to bequeathe to posterity the most important Motto which human language can convey, it should be in *three words*—

## Shut—your—mouth.

In the focial transactions of life, this might have its beneficial refults, as the most friendly, cautionary advice, or be received as the groffest of infults; but where I would point and engrave it, in every *Nurfery*, and on every *Bed-post* in the Universe, its meaning could not be mistaken; and if obeyed, its importance would foon be realized.

yes. Cathing .

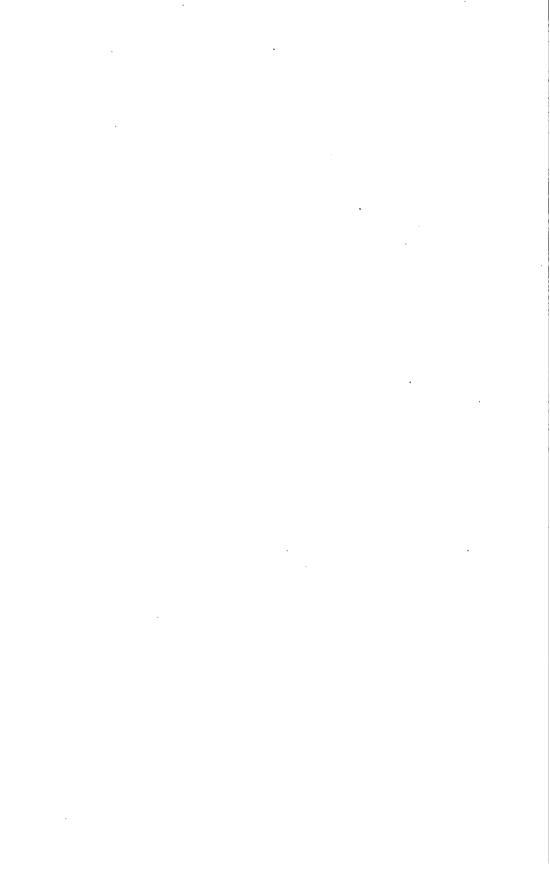

## APPENDIX.

FROM the obfervations, with their refults, on board of a Mail Steamer, given in a former page, together with numerous others of a fimilar nature made whilft I have been in the midft of Yellow fever and the Cholera in the Weft India Islands and South America; 1 confcientiously advance my belief, that in any Town or City where either of those pestilences commences its ravages, if that portion of the inhabitants who are in the nightly habit of fleeping with their mouths open were to change their refidence to the country, the infection would foon terminate, for want of fubjects to exist upon.

This opinion may be ftartling to many; and if it be *combated*, all the better; for in fuch cafe the important experiment will more likely be made.
